

## ABSTRACT

5 A readily dispersable wet wipe for cleaning surfaces is comprised of cellulosic fibers and produced on conventional papermaking equipment. The wet wipe substrate is preferably creped or embossed, and has a minimum basis weight of about 40 gsm.

Depending on the intended end use, solutions used to wet the substrate may comprise at least 35 percent alcohol. Wet wipe substrates wetted with solutions of less than 35 percent alcohol contain a wet strength additive such as polyamide.
